Management of password changes to active accounts is an important aspect of IT security. The attached file delineates active service accounts and current passwords.

Teams can manage service account passwords via access to Quotient from the main console located at,

auth.events.ccdc

Access the PCR feature on the left side menu.

Teams may manually type in new account credentials or paste from a CSV file any or all the service account changes to be made and hit Submit Changes.

Note that account password changes are immediately active without intervention by the scoring manager.

Note also that no admin, administrator, sysadmin, or root accounts are used for scoring. Teams may change the password to any of these accounts.

No notification of password changes is required, so there is no need to respond to this inject.
