Collegiate Cyber Defense Competitions

Inject Name	Configure Server-based Firewalls
Inject ID	SVRA05A

Description	For each server: configure software firewalls to only accept inbound expected packets as well as outbound expected packets. Be sure to understand inbound originating packets and the expected return packets when configuring rules. This should be done for both Linux and Windows servers.
Deliverables	Respond with a business memo that summarizes the security policies used on the each server. For example: SVR01 - Permits inbound TCP packets destined for port 80. - Allow web server return traffic. - Allow outbound DNS queries and the expected return. - Allow outbound NTP queries and the expected return. There should be a description for each server. Show screen shots of the configuration of one Windows server and one Linux server that shows the security rules and the product or OS feature used to implement this software firewall.
