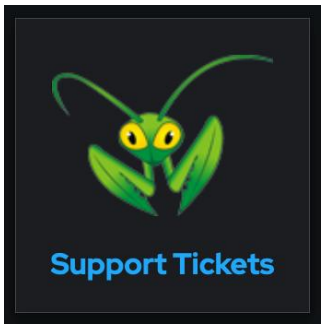
Technical Support and Scoring Inquiry

These services are now supported via Support Tickets, a part of the NextCloud suite of services accessed via the Application Dashboard at,

auth.ccdc.events



Issuing a support ticket is very easy and intuitive.

Use this feature to solicit technical support for issues occurring within the competition environment, such as a VM that freezes or appears to run out of resources. Competitors have the ability to power cycle VMs within the NETLAB environment, and should attempt this action prior to requesting tech support.

Teams should not use tech support as a means to request assistance for tasks and responsibilities that are part of the competition.

LIkewise teams may issue a support ticket to solict a service scoring inquiry.

Generally it is the responsibility of teams to maintain services to the 'public.' It is also the responsibility of teams, in the event of service failure, to determine the cause of failure and to take corrective action.

At the same time, network managers may seek the services of outside consultants where efforts to resolve the issue of a failed service have been unsuccessful. Issuing a support ticket for scoring inquiry will alert the scoring manager.

Response to scoring inquiries is at the discretion of the scoring manager.

Teams will see resolution to Support Tickets within the same system.

As such, there is no need for teams to respond to this inject.
